

Chemical Engineering Examples for the Romberg Rule for Integration Autar Kaw

Example 1

In an attempt to understand the mechanism of the depolarization process in a fuel cell, an electro-kinetic model for mixed oxygen-methanol current on platinum was developed in the laboratory at FAMU. A very simplified model of the reaction developed suggests a functional relation in an integral form. To find the time required for 50 % of the oxygen to be consumed, the time, $T(s)$ is given by

$$T = -\int_{1.22 \times 10^{-6}}^{0.61 \times 10^{-6}} \left(\frac{6.73x + 4.3025 \times 10^{-7}}{2.316 \times 10^{-11} x} \right) dx$$

Table 1 Values obtained using multiple-segment Trapezoidal rule.

| n | Value |
|-----|--------|
| 1 | 191190 |
| 2 | 190420 |
| 3 | 190260 |
| 4 | 190200 |

- Use Romberg's rule to find the time required for 50 % of the oxygen to be consumed. Use the 2-segment and 4-segment Trapezoidal rule results given in Table 1.
- Find the true error, E_t , for part (a).
- Find the absolute relative true error, $|\epsilon_t|$, for part (a).

Solution

a) $I_2 = 190420$ s

$$I_4 = 190200 \text{ s}$$

Using Richardson's extrapolation formula for Trapezoidal rule

$$TV \approx I_{2n} + \frac{I_{2n} - I_n}{3}$$

and choosing $n=2$,

$$\begin{aligned} TV &\approx I_4 + \frac{I_4 - I_2}{3} \\ &= 190200 + \frac{190200 - (190420)}{3} \\ &= 190130 \text{ s} \end{aligned}$$

b) The exact value of the above integral is,

$$\begin{aligned} T &= -\int_{1.22 \times 10^{-6}}^{0.61 \times 10^{-6}} \left(\frac{6.73x + 4.3025 \times 10^{-7}}{2.316 \times 10^{-11} x} \right) dx \\ &= 1.90140 \times 10^5 \text{ s} \end{aligned}$$

so the true error is

$$\begin{aligned} E_t &= \text{True Value} - \text{Approximate Value} \\ &= 1.9014 \times 10^5 - 190130 \\ &= 8.3322 \end{aligned}$$

c) The absolute relative true error, $|\epsilon_t|$, would then be

$$\begin{aligned} |\epsilon_t| &= \left| \frac{\text{True Error}}{\text{True Value}} \right| \times 100 \\ &= \left| \frac{8.3322}{1.90140 \times 10^5} \right| \times 100 \\ &= 0.0043823 \% \end{aligned}$$

Table 2 shows the Richardson's extrapolation results using 1, 2, 4, 8 segments. Results are compared with those of Trapezoidal rule.

Table 2 Values obtained using Richardson's extrapolation formula for Trapezoidal rule for

$$T = -\int_{1.22 \times 10^{-6}}^{0.61 \times 10^{-6}} \left(\frac{6.73x + 4.3025 \times 10^{-7}}{2.316 \times 10^{-11} x} \right) dx$$

| n | Trapezoidal Rule | $ \epsilon_r $ for Trapezoidal Rule % | Richardson's Extrapolation | $ \epsilon_r $ for Richardson's Extrapolation % |
|-----|------------------|---------------------------------------|----------------------------|---|
| 1 | 191190 | 0.55549 | -- | -- |
| 2 | 190420 | 0.14838 | 190163 | 0.014902 |
| 4 | 190210 | 0.037877 | 190127 | 0.0043823 |
| 8 | 190150 | 0.0095231 | 190133 | 0.00087599 |

Example 2

$$T = -\int_{1.22 \times 10^{-6}}^{0.61 \times 10^{-6}} \left(\frac{6.73x + 4.3025 \times 10^{-7}}{2.316 \times 10^{-11} x} \right) dx$$

Table 1 Values obtained using multiple-segment Trapezoidal rule.

| n | Value |
|-----|--------|
| 1 | 191190 |
| 2 | 190420 |
| 3 | 190260 |
| 4 | 190200 |
| 5 | 190180 |
| 6 | 190170 |
| 7 | 190160 |
| 8 | 190150 |

Use Romberg's rule to find the time required for 50 % of the oxygen to be consumed. Use the 1, 2, 4, and 8-segment Trapezoidal rule results as given in the Table 1.

Solution

From Table 1, the needed values from original Trapezoidal rule are

$$I_{1,1} = 191190 \text{ s}$$

$$I_{1,2} = 190420 \text{ s}$$

$$I_{1,3} = 190200 \text{ s}$$

$$I_{1,4} = 190150 \text{ s}$$

where the above four values correspond to using 1, 2, 4 and 8 segment Trapezoidal rule, respectively. To get the first order extrapolation values,

$$\begin{aligned} I_{2,1} &= I_{1,2} + \frac{I_{1,2} - I_{1,1}}{3} \\ &= 190420 + \frac{190420 - (191190)}{3} \\ &= 190160 \text{ s} \end{aligned}$$

Similarly

$$\begin{aligned} I_{2,2} &= I_{1,3} + \frac{I_{1,3} - I_{1,2}}{3} \\ &= 190200 + \frac{190200 - (190420)}{3} \\ &= 190130 \text{ s} \end{aligned}$$

$$\begin{aligned} I_{2,3} &= I_{1,4} + \frac{I_{1,4} - I_{1,3}}{3} \\ &= 190150 + \frac{190150 - (190200)}{3} \\ &= 190130 \text{ s} \end{aligned}$$

For the second order extrapolation values,

$$\begin{aligned} I_{3,1} &= I_{2,2} + \frac{I_{2,2} - I_{2,1}}{15} \\ &= 190130 + \frac{190130 - (190160)}{15} \\ &= 190120 \text{ s} \end{aligned}$$

Similarly

Saylor.org

$$\begin{aligned}
 I_{3,2} &= I_{2,3} + \frac{I_{2,3} - I_{2,2}}{15} \\
 &= 190130 + \frac{190130 - (190130)}{15} \\
 &= 190130 \text{ s}
 \end{aligned}$$

For the third order extrapolation values,

$$\begin{aligned}
 I_{4,1} &= I_{3,2} + \frac{I_{3,2} - I_{3,1}}{63} \\
 &= 190130 + \frac{190130 - (190120)}{63} \\
 &= 190130 \text{ s}
 \end{aligned}$$

Table 2 shows these increased correct values in a tree graph.

Table 2 Improved estimates of value of integral using Romberg integration.

| | | 1 st Order | 2 nd Order | 3 rd Order |
|-----------|--------|-----------------------|-----------------------|-----------------------|
| 1-segment | 191190 | | 190160 | 190130 |
| 2-segment | 190420 | | | |
| 4-segment | 190200 | | 190130 | |
| 8-segment | 190150 | | 190130 | |
